

Hackathon Submission: VeriSight AI

Global Scientific Media Forensic Analyzer

Team GuissiClean

January 29, 2026

Project Story: VeriSight AI

About the Project

The rise of DeepFakes has created a **global trust crisis**. We built **VeriSight AI** to restore digital integrity, ensuring that truth is no longer a luxury but a standard in the age of AI-driven deception.

Inspiration

The inspiration behind this project comes from the growing number of real incidents caused by deepfake technology:

- Fake political speeches shared online
- Manipulated videos used as false evidence
- Identity theft and reputation damage
- AI-generated content spreading faster than fact-checking mechanisms

What It Does

Our solution VeriSight is an **AI agent for scientific media authentication** that:

- Analyzes images and videos

- Detects AI-generated or manipulated visual content
- Differentiates between real media and synthetic media
- Identifies visual anomalies, artifacts, and inconsistencies
- Generates a detailed verification report with clear reasoning and evidence

The agent is designed to assist journalists, media platforms, institutions, and the general public in verifying content before sharing or acting upon it.

How We Built It

We built our project using a modular and scalable AI architecture powered by **Gemini APIs**. The system relies on:

- Multimodal analysis of images and videos
- AI reasoning to evaluate visual authenticity
- Pattern recognition to detect generation artifacts
- Automated report generation for explainability

Gemini's multimodal capabilities allowed us to combine visual understanding with logical reasoning, enabling the agent to produce human-readable explanations rather than black-box decisions.

Challenges we ran into

While static image detection is mature, **video analysis** is complex due to compression artifacts and temporal jitter. We overcame this by moving from simple pattern matching to **biological constant verification** via Gemini's reasoning.

Accomplishments

We successfully built a system that distinguishes real from fake even in low-quality social media videos. Our proudest achievement is the **Explainability Module**, which provides legal-grade proof to protect users from financial and reputational damage.

What we learned

This journey proved that Gemini 3 is more than a generative model; it is a sophisticated reasoning engine. We learned that fighting AI-generated lies requires **contextual intelligence** rather than just more data. We discovered how to orchestrate multimodal inputs to identify the subtle "uncanny valley" that separates AI from reality and How to align technical innovation with societal impact.

What's next for VeriSight AI

Our roadmap focuses on making truth accessible to everyone:

- **Real-Time Browser Shield:** A lightweight extension to warn users about deepfakes in real-time.
- **Enterprise API:** Integrating with newsrooms and social platforms to verify viral content at the source.
- **Digital Content Ledger:** Using blockchain to "anchor" verified authentic media, creating a permanent record of digital truth.

Our long-term vision is to make media authentication accessible world-wide and contribute to a safer and more trustworthy digital ecosystem.
